Overview Page (OVP) Floorplan

SAPUI5

Information

This floorplan is implemented with [SAP Fiori Elements](#).

To explore the design capabilities of SAP Fiori elements for OData V4 and experiment with their behavior, see [Overview Page](#) in the [SAP Fiori Development Portal](#).

Intro

View, Filter, and Take Immediate Action

The overview page (OVP) is a data-driven SAP Fiori app type and floorplan that provides all the information a user needs in a single page, based on the user's specific domain or role. It allows the user to focus on the most important tasks, and view, filter, and react to information quickly.

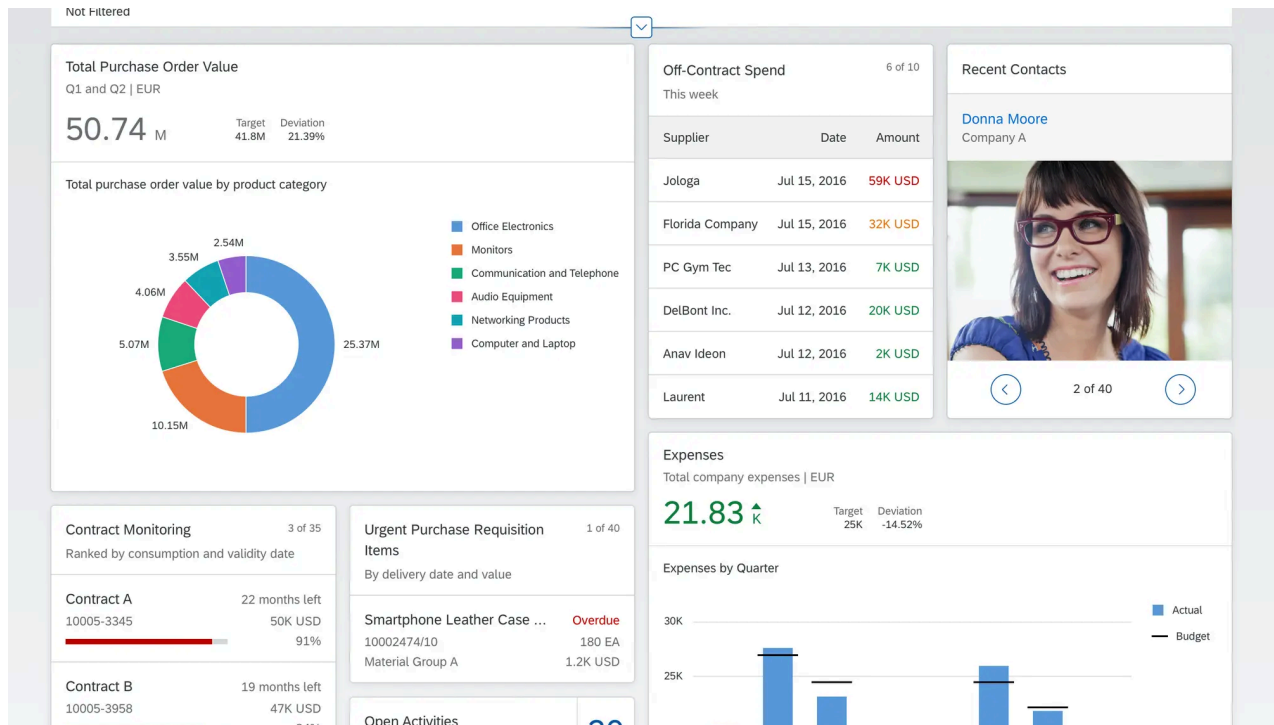

Each task or topic is represented by a card (or content container). The overview page acts as a UI framework for organizing multiple cards on a single page.

The overview page is based on [SAP Fiori elements](#) technology, and uses annotated views of app data, meaning that the app content can be tailored to the domain or role. Different types of card allow you to visualize information in an attractive and efficient way.

At a Glance

- Entry-level view of content on cards
- One specific context and task area for one role
- Content from different sources shows side by side – no need to switch screens
- Information can be visualized on cards in different ways (texts, charts, lists, tables)
- Micro actions let users react on the spot

[Feedback](#)

Overview page

When to Use

Use the overview page if:

- You want to provide an entry-level view of content related to a **specific domain or role**.
- Users need to filter and react to **information from at least two different applications** to complete their role-specific tasks.
- You want to offer **different information formats** (such as charts, lists, and tables) on a single page.
- You plan to have **at least three cards**. These cards should not all be of the same type.

Do not use the overview page if:

- A high-level or birds-eye view of application content is sufficient.
- You just want the user to launch an application. In this case, use the [SAP Fiori launchpad home page](#).
- You want to show information about one object only. In this case, use the [object page](#).
- You just represent one application and less than three cards. In this case, use the [object page](#).

Launchpad Home Page vs. Overview Page

Feedback

[Home page](#)

contains **all of a user's favorite apps** and offers access to them via [tiles](#). This covers all the roles that a user might have, such as employee, manager, production worker, or quality manager.

An overview page focuses on the **key tasks for a specific role**, and contains only the most frequently-used apps for that role. The overview page uses cards, which display more (preview) information than tiles because of their size, properties, and interaction areas. One card type also allows users to perform simple actions. Cards represent an entry-level view of application content.

Framework (given)	SAP Fiori application (optional)
"Birds-eye" view	"Street-level" view
Single point of entry	Specific business context for a role
One SAP Fiori launchpad per user	Multiple overview pages per user possible
Access to all the user's favourite applications	Selected applications are presented as cards
Uses tiles	Uses cards
No actions	Micro actions

The overview page is always role-based. The user sees a heterogeneous set of information related to a specific business context and the tasks associated with a specific role. This is not the case with the [object](#)

Overview Page vs. Object Page

Feedback

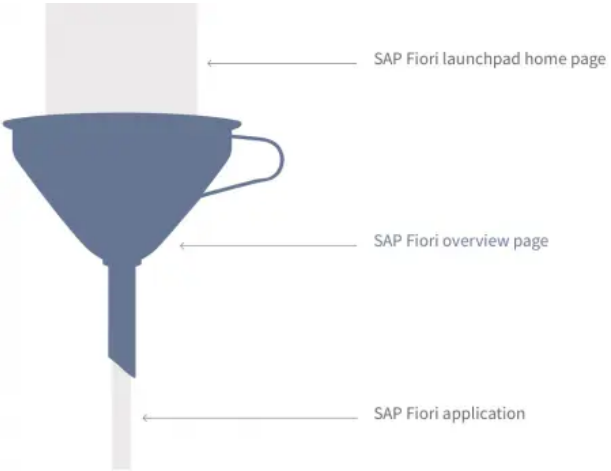

Contains
homogeneous,
object-based
information.

Overview Page	Object Page
Role-based	Object-based
“Street-level” view	“Details” view
Heterogeneous information	Homogeneous information

Role-Specific Overview Pages

As you can see in the picture, the overall content scope (shown in gray) becomes more focused with each interaction step. An overview page brings together information from different sources that support a specific task or information need. Only provide an overview app for a role if it makes sense to do so.

If a role or user has several main tasks that each require a specific set of information, the role or user might also have multiple overview apps. For example, one overview app could be used to reflect the user’s role as manager, with information for managing team performance reviews. Another overview app could be used to track quality issues and other relevant information pertaining to the machines that the user is responsible for in the role of quality manager.

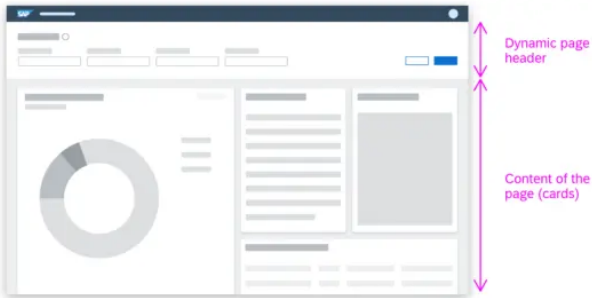

Metaphor – Different entry points in SAP Fiori

Components

The basic structure and appearance of the overview page is governed by the [dynamic page layout](#), and is divided into a header area and a content area.

This enables you to use variant management, text, and a smart filter bar in the upper part of the screen (dynamic page header). The content of the overview page is presented using [cards](#).

Two different [layouts](#) are available, which determine the size and position of the cards: [fixed card layout](#) and [resizable card layout](#).

Overview page – Basic structure

Feedback

variants are available for overview pages.

In the overview page, the header content is used for the [smart filter bar](#) with the live update mode (variant 1 and variant 2): the results are updated immediately whenever the user changes a filter field. As a result, there is no *Go* button for the filter bar.

Users can expand/collapse and pin the header content with the two icon buttons below the smart filter bar:

- 1. [Expand/collapse header](#): 
- 2. [Pin/unpin header content](#): 

Filter Summary

Dynamic Page Variants for the Overview Page

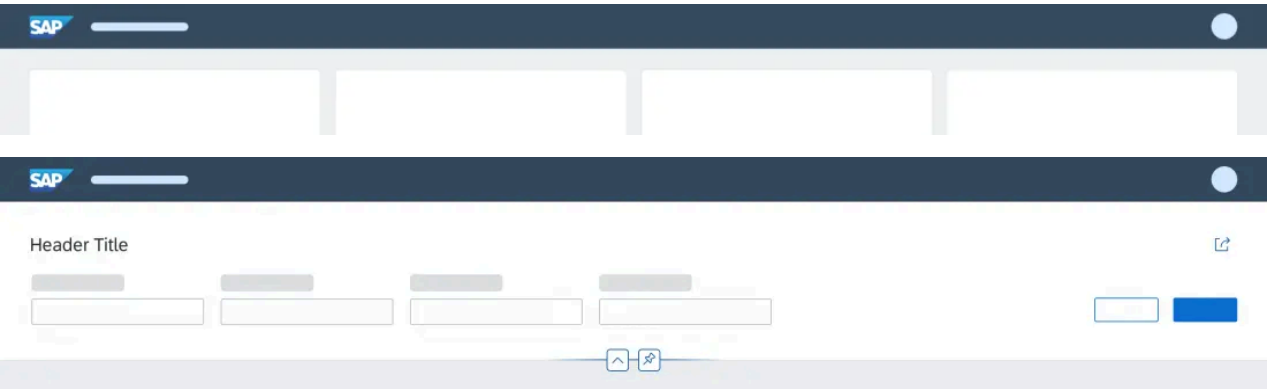

The header title (either text or variant management) is mandatory, while the header content (smart filter bar) is optional. Variant 3 shows only a text in the header title.

	Variant 1	Variant 2	Variant 3
Dynamic page header	Yes	Yes	Yes
Header title	Variant Management	Text	Text
Header content	Smart Filter Bar	Smart Filter Bar	–
Page content	Cards	Cards	Cards

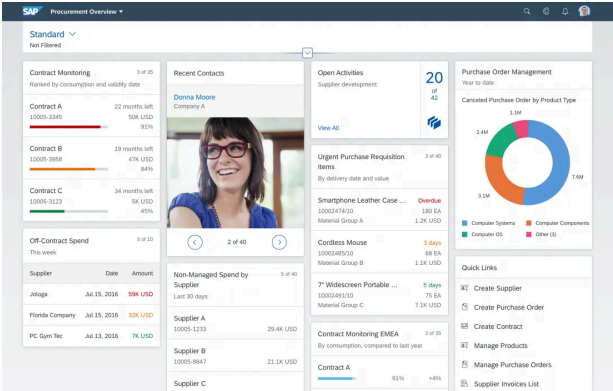

> Variant 1 – Variant Management and Smart Filter Bar (default)

> Variant 2– Text in the Header Title and Smart Filter Bar

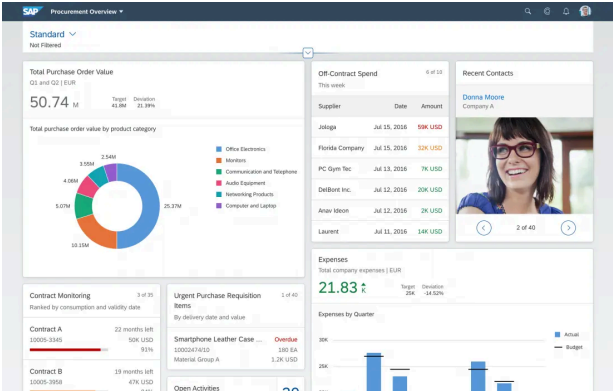

> Variant 3 – Text in the Header Title

Overview Page Layout

Fixed card layout

Resizable card layout

The overview page layout describes the position, size, and characteristics of cards in the content area below the dynamic page header.

There are two layout variants:

- [Fixed card layout](#)
- [Resizable card layout](#)

Only place [cards](#) on the overview page. Never add [tiles](#).

Fixed Card Layout vs. Resizable Card Layout

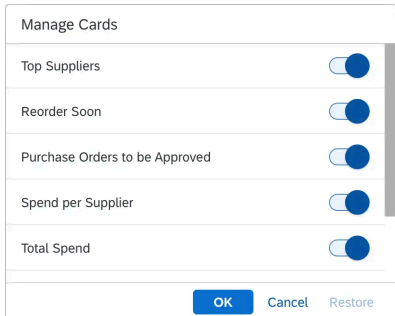

Fixed Card Layout	Resizable Card Layout
Fixed card width and predefined height	Resizable card sizes (grid-based)
Users can't influence the card size	Users can influence the card size individually
Predefined static card characteristics	Flexible content insights (such as more items, zoom, or different levels of detail)
Lower implementation effort – defined card patterns	Higher implementation effort – content strategy required
Self-contained cards	Highly interactive and flexible cards
Fast overview and navigation	Fast overview, navigation, and investigation
Cards can be swapped	Drag and drop supported for cards
Maximum of 5 card columns (letterboxing)	Unlimited number of columns

Personalized Selection of Cards

reinstates the default setup. The personalized setup stays until the user next changes it.

Each overview page app has its own *Manage Cards* setting. Users who work with several overview pages can personalize the cards shown for each one.

Overview page – 'Manage Cards' dialog after initial loading

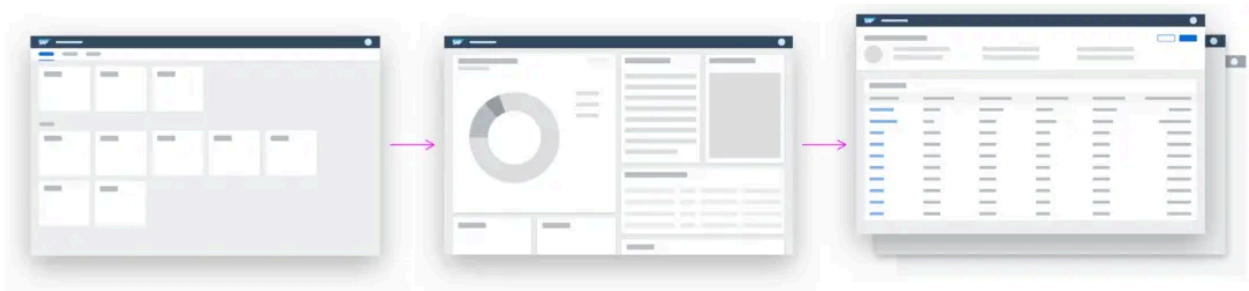

Behavior and Interaction

As for any other SAP Fiori app, users open overview page apps by selecting a tile on the [SAP Fiori launchpad home page](#), or by bookmarking the direct link in a browser. From the overview page the user decides which issues need attention, and navigates via cards to the relevant SAP Fiori apps. In addition, users can also access the [navigation menu](#) in the shell bar, which allows fast and easy navigation to other apps. The overview page supports navigation to both SAP Fiori and non-SAP Fiori apps. For SAP Fiori apps, it uses intent-based navigation. Non-SAP Fiori apps open in a new browser window.

In the screen flow, always position the overview page app between the SAP Fiori launchpad home page and the SAP Fiori app. The overview page doesn't replace the SAP Fiori launchpad home page. Never start overview page apps from another SAP Fiori app.

The picture below illustrates the complete interaction flow:

SAP Fiori launchpad home page → SAP Fiori overview app → SAP Fiori app or non-SAP Fiori app

Overview page – Interaction flow

Initial Focus

When the overview page is loaded, set the initial focus as follows:

- If no cards are loaded, and the filter bar is in manual mode, set the focus on the *Go* button or on the first filter field.
- If no cards are loaded, the filter bar is in manual mode, and a mandatory field is still empty, set the focus on the mandatory field.

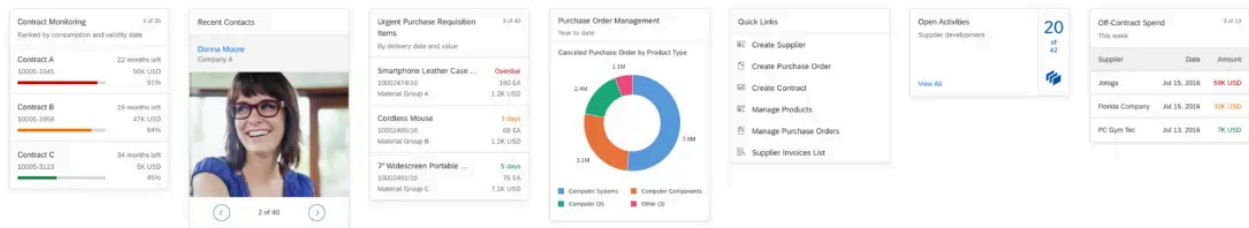

[Feedback](#)

Dedicated Floorplan

While other floorplans like the list report and object page can be combined in a single app, there is a **1:1 relationship between the overview page floorplan and the corresponding overview app**. The overview page floorplan is never combined with other floorplans. Because of this, the terms “overview page floorplan” and “overview (page) app” are often used synonymously.

Cards

Overview page – Different card types (selection)

Cards are containers for app content, and represent an entry-level view of the most pertinent app data for a given topic or issue. The overview page can contain several cards that reference the same underlying application. However, each card must bring added value to the user, and not just repeat information already offered on another card.

Cards can display different types of content. They can show a chart, a list, a table, informative text, or a combination of two elements. Cards can also vary in size, depending on the selected [layout](#). However, cards never have editable fields.

When designing cards, make sure that you define and format the texts on all the cards consistently. Check the [UI text guidelines for the overview page](#) for details.

For more information about the [cards](#) and [card types](#) available for the overview page, see the dedicated topics:

- [Analytical Card](#)
- [List Card](#)
- [Bar Chart List Card](#)
- [Link List Card](#)
- [Table Card](#)
- [Stack Card](#) | [Quick View Card](#)
- [Custom Card](#)

Information

Please note that the [integration cards](#) cannot be consumed by the overview page.

Responsiveness

Both feature responsive (collapsible) “columns” of cards that can scale all the way down to tablet or phone screen sizes. For more information on each card type, follow the respective links.

Top Tips

Before you start designing an overview page, familiarize yourself with following best practices to optimize the user experience. They reflect the basic findings of multiple usability tests across different scenarios and user groups.

- **Make a conscious decision on the number of cards:** Show only cards that really support the specific role context or task.
- **Accentuate the most important information:** Semantic colors in texts, charts, attract more attention. The same applies to larger cards.
- **Offer a well-balanced mixture of card types:** Diversity makes it easy to recognize, select, and read information.
- **Define a deliberate card order:** Users assume that bigger cards and cards at the top of the page are more important than others.
- **Group similar topics:** Users assume that related cards will be shown next to each other.
- **Choose easy-to-read and actionable texts:** If the user needs to take action, use the active voice (for example “Reorder Soon” when stocks are running low).
- **Be semantically consistent:** Users expect crucial terms like “Urgent” or “Out of Stock” to be highlighted with semantic colors.
