Multi-Instance Layout

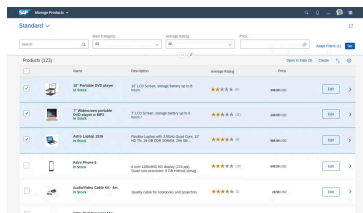

SAPUI5

Intro

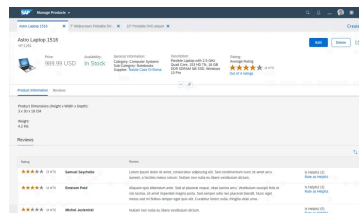

The multi-instance layout allows the user to display and edit multiple objects within one page.

Beforehand, the user selects the objects from another page, usually a list report or a table. Each object then appears on a separate tab.

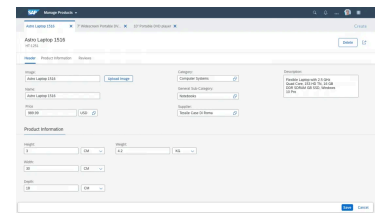

As a result, the user can work on several objects simultaneously and switch between them easily.

1. Select items in a list report

2. New page with several editable tabs

3. Tab in edit mode

Information

The multi-instance layout must be implemented by the app team.

Usage

Use the multi-instance layout if users need to open and edit multiple objects simultaneously.

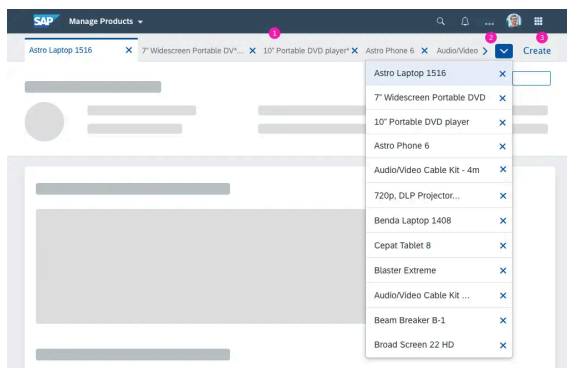

[Feedback](#)

Components

The multi-instance layout uses a [tab container](#).

The content of each tab is managed using an embedded [object page floorplan](#).

Components of the multi-instance layout

The tab container holds:

1. Opened [tabs](#)
2. [Scroll buttons and overview list](#) (if not all tabs can be shown on the screen)
3. A [Create button](#) (optional)

Tabs

Each tab represents one object. One tab is always active, while the others are inactive.

The tab contains a title and a *Close* button:

- **Title**

ID or name of the object. If the title text exceeds 25 characters, it is truncated.

An asterisk next to the tab title indicates that the object was changed but not saved.

Guideline: Use the same title as in the object page.

[Feedback](#)

Guideline: If the user closes a tab without saving first, display a warning. See [Handling Unsaved Changes](#).

Scroll Buttons and Overview List

The tab container has an overflow mechanism for cases where there are too many tabs to display on the screen:

- Horizontal scroll buttons ( >) can be used to scroll back and forth through the tabs.
- An overflow menu lists all the tabs, including the hidden tabs.

“Create” Button

You can offer a *Create* button on the far right of the tab container. Selecting this button opens a new tab containing an empty object page.

Guideline: Only use this button if the application allows users to create new objects.

Behavior and Interaction

Opening Tabs

The multi-instance layout is always triggered from another page, such as a list report.

To work on multiple objects, users select the relevant objects and choose a triggering action, such as *Open in Tabs (3)*. This opens a new page, in which the selected objects appear as tabs.

Closing Tabs

To close a tab, the user can click the *Close* () button on the tab itself, or close the tab from the overflow menu.

Closing the Last Tab

Handling Unsaved Changes

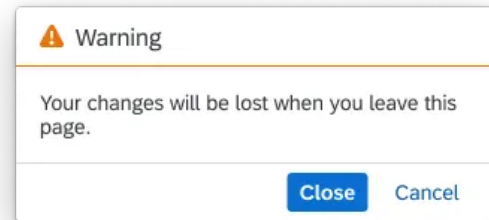

If objects have unsaved changes, the corresponding tabs show an asterisk (*) next to the title.

To prevent data loss, show a warning message in the following cases:

Case 1: The user tries to **close a tab with unsaved changes**.

Message type: Warning

Message text: *Your changes will be lost when you close this tab.* Buttons: *Close, Cancel*

Warning: Closing a tab with unsaved changes

Case 2: The user tries to **leave the page when one or more tabs have unsaved changes** (by clicking the *Back* button or navigating to a different page).

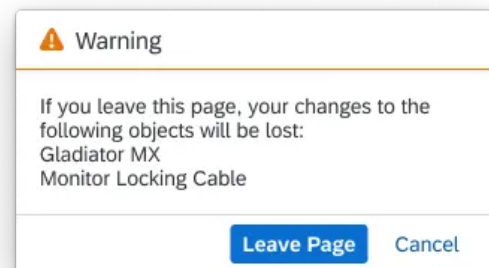

Message type: Warning

Message text: *If you leave this page, your changes to the following [objects] will be lost:*

[Object 1]

[Object 2]

Buttons: *Leave Page, Cancel*

Warning: Leave page when tabs have unsaved changes

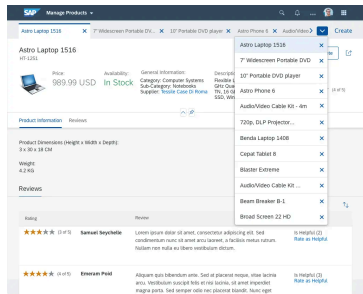

Responsiveness

The multi-instance layout is controlled by the sap.m.TabContainer control.

Top Tips

- To open the page containing the tabs, use a meaningful button text with the number of selected objects in brackets.
Recommended label: *Open in Tabs (number of objects)*
Example: *Open in Tabs (3)*.
- Use the same tab title as the object page title.
- Always use an object page floorplan to display the content of a tab.
