Flexible Column Layout

ui5-flexible-column-layout | v1.0

SAP Web Components

Intro

The flexible column layout is a pattern for displaying multiple floorplans on a single page. The flexible column layout is not restricted to a specific floorplan, as long as it is responsive down to phone size.

When to Use

Do

Use the flexible column layout:

- To create a list-detail or list-detail-detail layout, in which the user can drill down or navigate.

Don't

Don't use the flexible column layout:

- To display additional content to enrich the main content. Use the [dynamic side content](#) instead.
- To create a dashboard with context-independent pages.
- To open multiple instances of the same object type.
- To split a single object into multiple columns.
- To display only a small amount of information.

Anatomy

1. **Columns:** Depending on the current layout and display size, the flexible column layout consists of one, two, or three horizontally-aligned columns. Each column contains content that is not provided by the flexible column layout itself.
2. **Layout Arrow:** The layout arrows allow users to expand the width of a given column and change the current layout.

Anatomy of the flexible column layout

displayed as the last actions in the respective layout action section, in the last column (rightmost for left-to-right orientation). They never overflow and are always in the same order. The actions are not available for phone sizes, which display only a single column.

Behavior and Interaction

Expanding the Column

With the layout arrows, users can expand the width of a given column and change the current layout.

The layout arrow points in the direction in which a column can be expanded.

Full Screen Mode

The  *Enter Full Screen* button switches the rightmost column to full screen mode.

The  Full Screen button switches back to the multi-column view. This action is only available in full screen mode.

After switching a column to full screen mode, selecting the *Back* button also exits the full screen mode.

If the screen is in full screen mode, and the user navigates forward, the next column shows in full screen mode. If the user navigates backward, all screens show in full screen mode until the point where the user initially switched to full screen. If the

Closing the Last Column

The  *Close* button closes the last column. Back navigation doesn't restore a column that was previously closed with the *Close* button.

If the last column was in full screen mode when it was closed, the second column is displayed full screen mode.

Vertical Size / Scrolling

The height of each floorplan is defined by the screen size.

Each column inside the flexible column layout contains an independent floorplan with its own scrolling behavior. There is no scrollbar to scroll all columns simultaneously.

Minimized Third Column

When the user expands the first column in a 3-column layout, the third column is minimized.  *Close*,  *Enter Full Screen*, and layout arrow actions also appear on the right-hand border of the second column to allow the user to return to the original 3-column layout.

When the user clicks  *Enter Full Screen*, the second column switches to full screen mode. The third column remains open (but not visible), and closes as soon as the user selects another item in the second column, or uses the  *Close* action in the second column. If the user selects the same item in

Selecting a Different Item

If the user selects a different item in the list-detail or list-detail-detail layout, the content of the details column changes to reflect the data of the newly selected item.

If the item is selected in the first column, and the last column was open before the new item was selected, selecting the item closes the last column.

Deleting an Item

When an item is deleted, there are two options for handling the content of the details columns:

Option 1: Selecting the next item and changing the content in the details column. If the user deletes the last item, the previous item is selected.

Option 2: Not selecting an item and closing the other columns.

Behavior on Filtering

Filtering in one of the columns doesn't affect the content in the other columns.

When a filter is applied, the results are shown in the same column. The content in the remaining columns doesn't change, unless another item is selected.

Tab/Anchor Navigation

Tabs and anchors are used for navigation within an object or as a filter (for example, in object pages). They affect only the

Dialogs

Dialogs triggered in one of the columns are centered over the entire screen.

Footer Toolbar

Each column of the flexible column layout can have its own footer toolbar. There is no overall footer toolbar that spans several columns.

Responsive Behavior

The flexible column layout is responsive. It changes its behavior in real time when the user resizes the screen. For any size, the default layout appears automatically.

Size L and XL (screen width > 1024 px)

There are five different layouts: a full screen layout, a 2-column layout, and a 3-column layout.

Size M (screen width between 600 px and 1023 px)

There are two different layouts: a full screen layout and a two 2-column layout.

For example, if the flexible column layout was initially loaded in size S and the user then navigates to the second column and changes the browser window to size M, the default 2-column layout for size M will show.

Three columns in size M

To offer a desktop-like experience in size M, the flexible column layout displays either the first and second or the second and third column. The user can switch between these views by using the layout arrow on the left or right side of the flexible column layout. This behavior is only intended for size M.
