Page Layouts and Floorplans

Intro

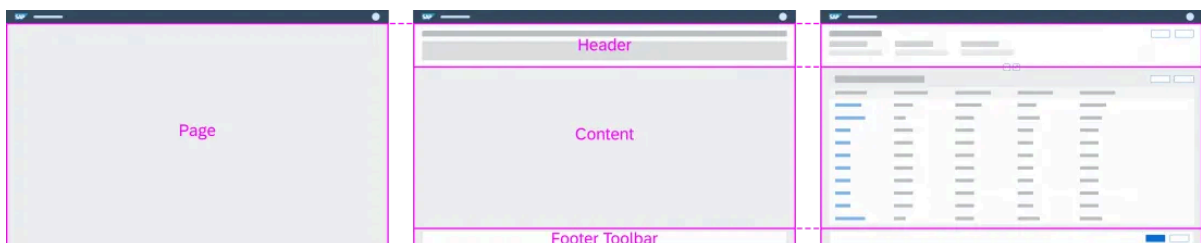

This article provides an overview of how SAP Fiori layouts and floorplans are used to build application pages.

Page Layouts vs. Floorplans

The standard page **layout** in SAP Fiori is the [dynamic page](#), which is made up of a header, content area, and footer toolbar.

Floorplans are usually based on the dynamic page. Floorplans serve specific use cases and therefore come with a specific combination of UI elements in the header, content area, and footer toolbar.

The following visual shows the composition of the dynamic page layout and how the elements of a list report floorplan are built into it. Never insert a whole floorplan into just the content area of the dynamic page layout.

Page - Dynamic page - Floorplan

Full Screen vs. Flexible Column Layout

You can decide whether your app uses a full screen layout (one page at a time) or a [flexible column layout](#) for list-detail relationships (up to three pages side by side). The flexible column layout enables fast and fluid navigation between pages.

More Information

- For a general introduction, see [Get to know the information architecture: Layouts, floorplans, UI elements](#).
- For a description of all floorplans, their characteristics, and when to use them, see [When to use which floorplan](#).
- For structuring business data in the page header and content areas, SAP Fiori offers a variety of layouts and containers. Examples are [forms](#) and [the dynamic side content](#). Find more in the UI Elements section *Form / Layout / Container*.

Information

To control and optimize the left and right spacing between header and content area and between UI elements (such as tables and forms), we offer a [responsive spacing system](#).

Additional Layouts

The following layouts have been designed for special use cases:

Layout	Use Case
Comparison	Allows users to select items from a list and display them side-by-side. To compare the characteristics of multiple items.
Multi Instance	Allows users to open multiple documents in a tabular view. After selecting the user opens them in a tab container.
